

Translation ReadMe

Because of the way we are doing translations (within the constraints of Python), there are a couple things we should all pay attention to:

- There doesn't seem to be any difference on the use of `_("").format()` syntax or `_("").format()` syntax
- The best practice may be to put a semantically helpful keyword for each variable, like this:

```
_("{name} Dictionary and Orthography Checker").format(name=self.program['name'])
```

- Otherwise, there doesn't seem to be any way to bring the format items into the translation, so we're stuck hopefully understanding more or less what each `{}` means.

- The following formats work:

- format()ed string on one line:

```
_("Language with code [{}]").format(xyz)
```

- format()ed strings, with format on line after reference

```
_("{} doesn't look like a well formed lift file; please "
  "try again.").format(filename)`
```

- format()ed strings with multiple references to the same format item, given at the end

```
_("Your regular expressions look OK for {0} (there are "
  "no segments in your {0} data that are not in a regex). "
  "Note, this doesn't \nsay anything about digraphs or "
  "complex segments which should be counted as a single "
  "segment --those may not be covered by \n"
  "your regexes.").format(lang))`
```
